

Chiropractic Care Can Help Infants and Children with Various Health Issues

Asthma is the most common chronic disease of childhood, affecting more than six million children in the United States. Multiple studies have been done on the use of chiropractic in the treatment of asthma, most which have concluded that this practice may lead to subjective improvement in the patient.

Chiropractic care, in addition to treating asthma, may also aid infants and children with issues like colic and nursing difficulties. A 2009 study at the Anglo-European College of Chiropractic revealed a positive relationship between chiropractic therapy and improved crying behavior in infants. Another study discovered an improvement in infant breastfeeding difficulties following a short course of chiropractic care.

Pediatric chiropractic care is a safe and effective alternative for children with health issues such as asthma, colic and nursing difficulties. This complementary alternative has helped millions of infants and children worldwide.
